Separation of Duties, Record Visibility & Enquiry-to-Revenue

Date: 22 June 2026 · Status: Delivered & Tested · Pushed to GitHub (main)

1. Executive Summary

This release strengthens how people see and act on information inside the CRM, and connects sales enquiries to the revenue pipeline. Three outcomes were delivered and tested:

- The Tenant Administrator is now a back-office role only — it manages users, roles, settings and integrations, but cannot see any operations or billing. This is a clean separation of duties.
- Every staff member now sees only their own work; a line manager sees their team; a department manager sees their department — consistently across Contacts, Deals and Activities.
- A sales enquiry raised by the support function now flows into the sales pipeline as a forecastable deal, so no opportunity is lost between teams.

2. What Changed

2.1 Tenant Administrator is administrative-only

Previously the administrator could see everything in the workspace. Now responsibilities are split the way leading CRMs separate them:

Area	Tenant Administrator	Operational staff
Users, roles, settings, integrations	Yes — full control	No
Contacts, deals, activities, dashboards	No	Yes (scoped)
Tickets & sales / invoicing	No	Yes (scoped)
Billing (subscription & invoicing)	No — moved to Finance/Sales	Finance role

Protection is applied in two layers: the menu items are hidden, and the system itself refuses operational data to an administrator even if a page address is entered directly.

2.2 Record visibility follows the reporting line

Visibility is now driven by the line-manager reporting tree and applied as a hard filter — a user genuinely cannot see records outside their branch:

- An agent sees only the records they own.
- A line manager sees themselves plus everyone who reports to them.
- A department manager sees their whole department (their entire sub-tree).

The same rule governs the Contacts, Deals and Activities screens and the pipeline-value totals, so figures always match what the user is allowed to see. A company-wide operational view can be enabled at any time simply by appointing a senior manager above the department heads — no further development required.

2.3 Sales enquiry becomes a pipeline deal

When a sales-type ticket is accepted, the system automatically creates a linked deal in the sales pipeline (owned by the handling agent, carried over with the customer details). Agents also have a

manual “Convert to Deal” button. Complaints are unaffected and keep their normal resolve-and-close lifecycle.

2.4 Supporting improvements

- Customer record now shows the live TAT (turnaround) countdown on each open ticket, alongside its stage.
- New workspace onboarding e-mails the temporary password to the customer; administrators can reset and re-send it (SendGrid).
- Routing & SLA configuration tab is hidden from the platform super-admin view.

3. Testing Evidence

Test	Result
Administrator opens Contacts / Deals / Tickets / Sales / Billing	Blocked (refused)
Administrator opens Users / Roles / Settings / Integrations	Works
Agent / line manager / dept. manager record visibility (1 / 2 / 3 levels)	Correct at every level
Accept a sales ticket	Linked deal created in pipeline
Accept a complaint ticket	No deal (lifecycle unchanged)
Convert the same ticket twice	No duplicate — same deal returned

4. Technical Appendix

For the development team. All changes are on the main branch.

- Gateway block: `packages/api/src/server.ts` — `tenant_admin` denied `operational/billing` prefixes.
- Visibility helper: `packages/api/src/lib/visibility.ts` — `getVisibleUserIds` (recursive `manager_id` CTE) + `ownerScopeSql`; applied in `contacts.ts`, `deals.ts`, `activities.ts`.
- Sales→deal: migration `024_ticket_deal_link.sql` (`tickets.deal_id`); `convertSalesTicketToDeal` in `tickets.ts`; auto on accept + `POST /:id/convert-to-deal` (idempotent).
- Frontend: `App.tsx` (admin routing + nav), `useRole.ts` (`useIsTenantAdmin`), `Tickets.tsx` (Convert to Deal button), `ContactDetail.tsx` (TAT countdown), `Settings.tsx`, `SuperAdmin.tsx`.
- Known pre-existing issue (separate task): `GET /api/v1/departments` returns 500 — query references a non-existent `users.department_id` column.
